In a hurry? Go straight to section 3. It takes about five minutes, and it's all you need to get the EA armed for the next release.

1. How GoldenStraddler trades

GoldenStraddler trades gold (XAUUSD) in the seconds around high-impact US economic releases, the "red-folder" events such as Non-Farm Payrolls, CPI and FOMC decisions. Those releases often move gold sharply, but nobody knows in advance which way. So the EA doesn't guess. It places an order on both sides and lets the release choose.

Step by step, with the default settings

1. **5 seconds before the release** it sends a **buy stop 60 points above the ask** and a **sell stop 60 points below the bid** at the same moment, 0.10 lots each, priced from the latest tick. Each order carries a **100-point stop loss** and no take profit. If the spread has already widened, both go further out: entry and stop are never closer than **twice the live spread**.
2. **The release hits**. Price breaks one way and fills one of the orders. The moment that happens, the other order is deleted, so you're only ever in one trade. If a spike fills both before the delete lands, the older trade is closed straight away.
3. **Nothing moves until the trade is 50 points in profit**. From then on the stop loss follows **50 points behind price** and only ever tightens. It never moves back.
4. **The trailing stop closes the trade** when price turns. If the news window is still open, a fresh buy stop and sell stop go on around the new price straight away.
5. **30 seconds after the release** the window closes. Any pending orders are removed. A trade that's still open keeps trailing until its stop closes it.

Where the news comes from

The EA downloads the week's red-folder USD events from ForexFactory's public calendar feed. If that's unavailable, it falls back to MetaTrader 5's own economic calendar, and it keeps a saved copy on disk, so a restart doesn't lose the week. Timing uses your broker's tick clock rather than your computer's clock, so "5 seconds before" means 5 seconds on the trade server.

Between releases it does nothing. That's by design. Most weeks have a handful of red-folder USD events, and the EA only trades around them. If you want it trading all the time, there's an "Always on" mode (section 5), but that's a very different, much busier way of trading.

2. Before you start

Tick these off first. They're the difference between a smooth first release and a frustrating one.

- ☐ **MetaTrader 5 for Windows**, installed and logged in to your trading account. GoldenStraddler doesn't run on MetaTrader 4. On a Mac, use a Windows VPS (section 8).
- ☐ **A broker that offers gold** on MT5. Any symbol name works: XAUUSD, GOLD, XAUUSD.r and so on. A raw-spread or ECN account with fast execution gives the best fills around news.
- ☐ **Your licence key**. It's on your account page at goldenstraddler.com/account and in your licence email. It looks like `GS-XXXX-XXXX-XXXX-XXXX`.
- ☐ **A plan for keeping MT5 online**. The EA only works while MetaTrader 5 is open and connected at release time. A Windows VPS is the reliable way to do that.
- ☐ **A demo account, if you want to try it first**. The licence locks to the first account it runs on, and you can move it to your live account straight away from your account page.
- ☐ **Your prop firm's rules**, if you trade a funded account. Many don't allow trading around news.

About lot size. The default is 0.10 lots per order. With most brokers' gold contract (100 ounces per lot), each point (0.01) is worth about \$0.10 at 0.10 lots, so the 100-point stop loss risks about \$10 plus slippage and costs. Set the size that fits your account before you go live.

3. Install it in five steps

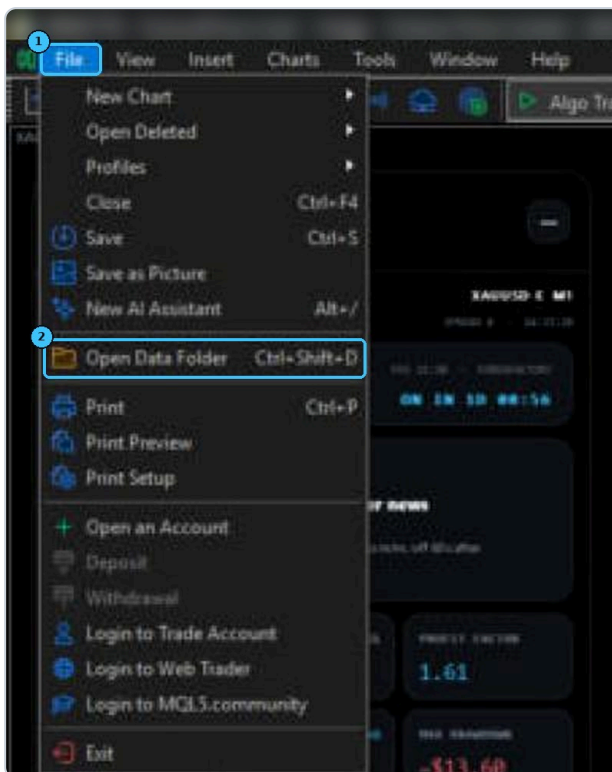

About five minutes, start to finish. The pictures are real MetaTrader 5 screens; yours may look slightly different depending on your broker's colours.

1 Download the EA.

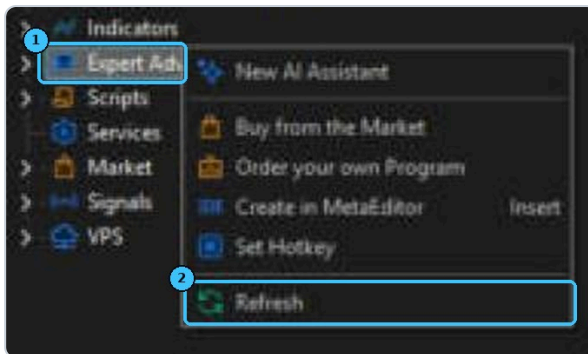

Sign in at goldenstraddler.com/account and click **Download GoldenStraddler.ex5**. Your licence key is on the same page, with a **Copy** button. You can download the EA again any time, for example on a new PC or VPS.

2 Put the file into MetaTrader 5.

In MT5 click **File** (1) and then **Open Data Folder** (2). In the folder that opens, go into **MQL5**, then **Experts**, and copy [GoldenStraddler.ex5](#) in there.

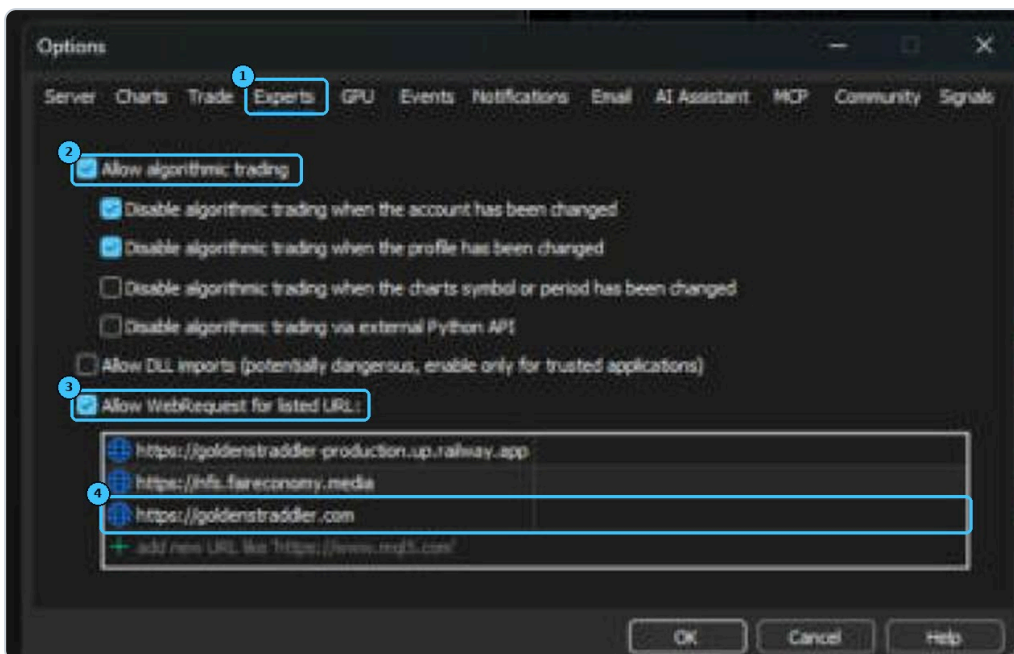

Back in MT5, show the Navigator with **Ctrl** + **N**, right-click **Expert Advisors** (1) and choose **Refresh** (2). GoldenStraddler now appears in the list.

3 Allow its web address.

Click **Tools** → **Options** and open the **Experts** tab (1). Tick **Allow algorithmic trading** (2) and **Allow WebRequest for listed URL** (3). Then double-click the last row of the list, type `https://goldenstraddler.com` (4) and press **Enter**. Click **OK**.

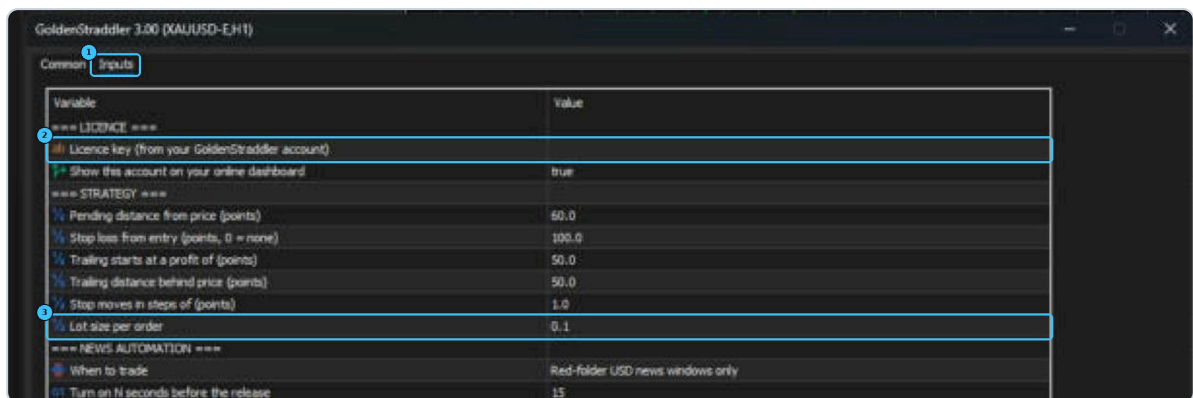

Other addresses already in your list can stay. Without this one the EA can't check its licence or load the news calendar.

4 Attach it to a gold chart.

Open an **XAUUSD** chart (any timeframe; your broker may call it **GOLD** or **XAUUSD.r**) and drag **GoldenStraddler** from the Navigator onto it. A settings window opens. On the **Common** tab, make sure **Allow Algo Trading** is ticked.

Then open the **Inputs** tab (1). Double-click the empty value next to **Licence key** (2) and paste your key. Check **Lot size per order** (3) and change it if you need to. Click **OK**.

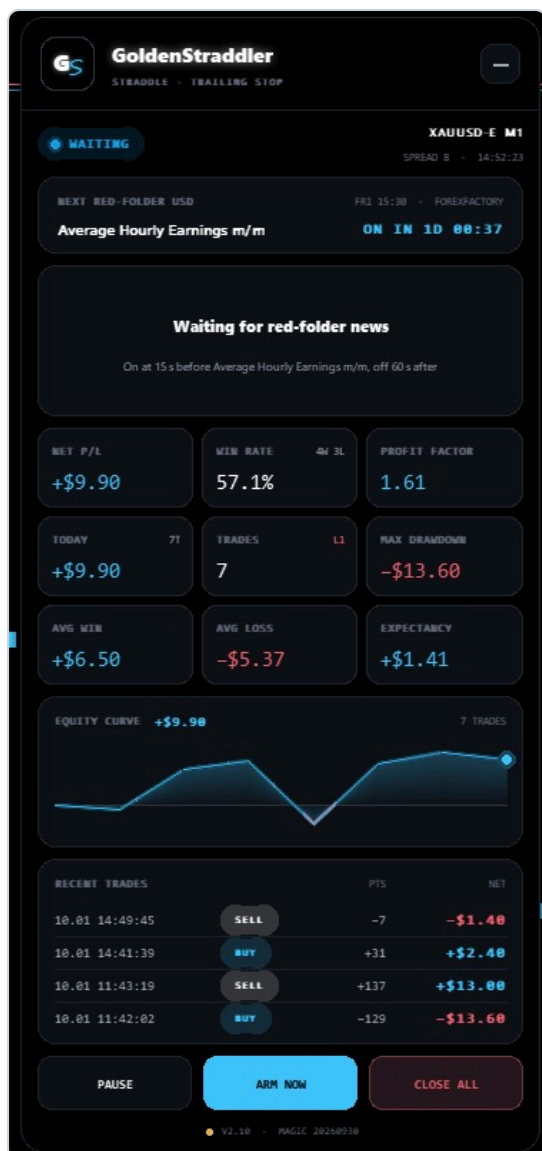

5

Turn on Algo Trading.

Click **Algo Trading** in the MT5 toolbar so its icon turns green.

Within a few seconds the GoldenStraddler panel appears on the chart. It shows **WAITING** with the next red-folder release and a countdown, and your licence at the bottom. **That's it.** Leave MT5 running: the EA arms itself 5 seconds before the next release.

What you'll see

This is a real GoldenStraddler panel, captured from our own live account on 1 October 2026. Yours fills in as your own trades close: net profit, win rate, profit factor, drawdown, the equity curve and the most recent trades.

Section 4 explains every state and button on it.

4. Reading the panel on your chart

The panel in the corner of your chart (pictured at the end of section 3) shows what the EA is doing right now, your open position and your statistics. The coloured state badge is the part to watch.

State	What it means	What to do
WAITING	Outside a news window. The panel shows the next red-folder release and a countdown.	Nothing. This is normal most of the time.
ARMED	Inside a window. The buy stop and sell stop are placed, or about to be.	Nothing. Let it work.
IN TRADE	One side filled. The trade is open with its stop loss, then trails once it's 50 points in profit.	Nothing. The stop closes it.
PAUSED	You pressed PAUSE. No new orders. Open trades keep trailing.	Press RESUME to start again.
ALGO OFF	Algo Trading is switched off in MT5, so the EA can't place orders.	Click Algo Trading in the toolbar.
REJECTED	The broker rejected an order. The panel shows the broker's reason.	See section 9.
LICENCE	The licence isn't active on this account. The panel says why.	See section 7 and section 9.

The three buttons

Button	What it does
PAUSE / RESUME	Stops the EA placing new orders, or starts it again. An open trade keeps its stop and keeps trailing while paused.
ARM NOW	Opens a manual window straight away, as if a release were due: 35 seconds with the default settings. Handy for a release that isn't on the calendar. Use it with care.
CLOSE ALL	Asks you to confirm, then closes GoldenStraddler's positions and deletes its pending orders on this chart's symbol, and pauses the EA. Press RESUME when you want it trading again.

The footer of the panel shows your licence: **LIFETIME LICENCE**, **LICENCE TO** a date for monthly plans, or a warning if something's wrong.

5. Every setting explained

Press **F7** on the chart to open the inputs at any time. Distances are in points for a 2-digit gold quote, where 1 point = 0.01. On a 3-digit quote they're multiplied by 10 for you.

Updating from an older version? MT5 keeps the inputs saved on the chart, so new defaults don't replace them. After updating, press **F7** and check the values below, or click **Reset** and paste your licence key again.

Licence

Input	Default	What it does
Licence key	empty	Paste the key from your account page.
Show this account on your online dashboard	true	Sends status and closed trades to your private dashboard. Switch off if you don't want that. The licence check still runs.

Strategy

Input	Default	What it does
Pending distance from price	60	How far above the ask and below the bid the stop orders go.
Stop loss from entry	100	Initial stop loss on each order. 0 means none, which isn't recommended.
Trailing starts at a profit of	50	The trade must be this far in profit before the stop starts to move.
Trailing distance behind price	50	How far behind price the stop follows.
Stop moves in steps of	10	Minimum change before the stop is moved, so the broker isn't flooded with tiny changes in fast markets.
Lot size per order	0.10	Volume of each pending order.
Entry and stop at least N x the live spread	2.0	When the spread widens, the pending distance and stop loss grow to at least this many times the spread, so the orders aren't triggered by the spread alone. 0 switches it off.

News automation

Input	Default	What it does
When to trade	News only	Red-folder USD news windows only , or Always on to trade continuously.
Turn on N seconds before	5	When the window opens before each release.
Keep running N seconds after	30	When the window closes after each release.
Where events come from	FF + MT5	ForexFactory with MT5's calendar as backup, either one alone, or both combined.
Currency	USD	Which currency's high-impact events to trade.
News calendar feed	goldenstraddler.com	Leave as it is. It's ForexFactory's weekly calendar, served from our site.

Execution and display

Input	Default	What it does
Magic number	20260930	Tags the EA's orders. Use a different number on each chart if you run more than one.
Order comment	GoldenStraddler	Text shown on orders in MT5.
x10 point inputs on 3-digit gold	true	Scales the point inputs on 3-digit quotes. Leave on.
Show dashboard, corner, offsets, size		Where and how big the chart panel is drawn.
Apply the chart colours	true	Gives the chart the GoldenStraddler look.
Statistics look-back in days	0	0 counts all history. Otherwise only the last N days.
Export closed trades to CSV	true	Writes your closed trades to a CSV in MT5's Common\Files folder.

6. Your online account and dashboard

Everything about your licence lives at goldenstraddler.com/account. Sign in with the email you bought with: we send you a 6-digit code. You can also sign in with that email and your licence key.

What's on the page

- **Your licence.** Copy your key, see your plan, which MT5 account it's locked to, and whether the EA is online right now.
- **Downloads.** The latest EA and this guide.
- **Live from MT5.** The EA's state, your open position, balance and equity, and the next high-impact releases, updated every few seconds while MT5 is running.
- **Performance.** Net profit, an equity curve, profit per trade, results by hour and by side, with day, 7-day and 30-day filters.
- **Trades.** Every closed trade the EA placed, with entry, exit, points, costs and running total.
- **Orders.** Your payments, and the refund button during the money-back period.
- **Help.** A form that reaches us directly. We answer by email.

The dashboard only shows trades placed by GoldenStraddler on the licensed account. It updates while MT5 is running with **Show this account on your online dashboard** switched on.

7. Your licence, accounts and renewals

One licence, one account

Your licence locks to the first MT5 account it runs on. To use it on a different account, for example moving from demo to live or to a new broker, open your account page and click **Move to another MT5 account**. Then attach the EA with your key on the new account, and it locks there. The old account stops placing new orders. You can move a licence once every 30 days.

If the internet drops

The EA checks the licence with our server when it starts and then from time to time. A good answer is trusted for 48 hours, so a short outage on our side or yours doesn't stop trading. To keep things fast, the EA never contacts our server during a news window, in the minute before one, or while its orders are working.

Monthly plans

- **Card or wallet:** renews by itself every month. Cancel any time with **Manage subscription** on your account page. It stays active to the end of the month you've paid for.
- **Bank transfer or crypto:** doesn't renew by itself. Use **Pay next month** on your account page. We email you a reminder before it runs out.
- **When a month isn't renewed** you get three extra days. After that the EA shows **SUBSCRIPTION ENDED**, stops placing new orders and removes its pending orders. A trade that's already open keeps its stop and trailing until it closes. Renew and it starts working again on its own.

Lifetime

A lifetime licence has no expiry date and includes all future updates.

Keep your key to yourself. A licence runs on one account. Sharing a key gets it switched off.

8. Running it on a VPS

A Virtual Private Server is a Windows computer in a data centre that stays on around the clock. It's the dependable way to make sure MT5 is running at every release, even when your own computer is off.

What to look for

- **Windows** with at least 2 GB of RAM. One MT5 terminal with a couple of charts runs comfortably on that.
- **Close to your broker's servers.** Many brokers' MT5 servers are in London, New York or Equinix data centres. Every order and every stop change makes a round trip to that server, so lower latency means better fills around news. MT5 shows the ping in the bottom-right corner; for news trading, a few milliseconds is ideal. Some brokers offer a free or discounted VPS.

Setting it up

1. Connect to the VPS with Remote Desktop.
2. Install MetaTrader 5 from your broker and log in.
3. Follow section 3 on the VPS. Download the EA from your account page in the VPS's browser.
4. Make sure Windows doesn't sleep or restart for updates at awkward times, and that MT5 starts again if the VPS restarts.
5. Disconnect from Remote Desktop by closing the window. Don't sign out of Windows, or MT5 closes too.

Run it in one place only. If the same licence runs on your PC and your VPS on the same account, both copies place orders. Remove it from the chart on the machine you're not using.

9. Fixing common problems

The panel says	Why	Fix
Allow https://goldenstraddler.com under Tools > Options	The licence address isn't in the WebRequest list.	Add it exactly as in section 3, step 3, then re-attach the EA.
Paste your licence key in the EA inputs	The key is empty.	Press F7 and paste the key from your account page.
This licence key doesn't exist	A typo or a missing character.	Copy it again with the Copy button on your account page.
This licence is locked to account ...	It's already locked to another MT5 account.	Move it from your account page (section 7).
Your subscription has ended	A monthly plan wasn't renewed.	Renew from your account page. It starts again by itself.
Can't reach the licence server	No internet, or a firewall is blocking MT5.	Check the connection. Trading carries on for up to 48 hours after the last good check.
Turn on Algo Trading	The toolbar button is off, or Allow Algo Trading isn't ticked on the EA's Common tab.	Switch both on.
Order rejected: invalid stops	Your broker's minimum stop distance is bigger than the settings.	Increase the pending distance or stop loss, or ask your broker about its stop level.
Order rejected: not enough money	The lot size is too big for your free margin.	Lower the lot size.
Orders placed further out than the pending distance	The spread was wide when they went in.	Nothing to fix: entry and stop are kept at least 2× the spread away. Set Entry and stop at least N x the live spread to 0 to turn that off.
No upcoming releases shown	The calendar couldn't load.	Check that https://goldenstraddler.com is in the WebRequest list. MT5's calendar is used as a backup.

Still stuck?

Use the help form on your account page. A screenshot of the chart panel and the **Experts** tab at the bottom of MT5 (**Ctrl** + **T** opens it) helps us answer quickly. After each release the EA

also prints a timing summary to the Experts tab and adds it to

GoldenStraddler_timing_<magic>.csv in MT5's **Common\Files** folder (**File > Open Data Folder**, then up one level and into **Common**). Attach that file if fills seemed slow.

10. Trading it sensibly

GoldenStraddler is a tool, not a promise. It trades the most volatile seconds of the week, and that cuts both ways.

- **Start on demo.** Watch a few releases before you put real money behind it. You can move the licence to your live account straight away.
- **Size small.** Pick a lot size where a full stop loss plus slippage is an amount you're comfortable losing, many times over.
- **Expect slippage.** Around news, spreads widen and stop orders can fill away from their price. Your broker and your VPS matter a lot.
- **Expect losing releases.** Some releases spike and snap back into the stop loss. Some do nothing at all. Judge it over many releases, not one.
- **Know your firm's rules.** Many prop firms ban news trading.
- **Keep an eye on it.** Check the panel or your dashboard before big releases, especially after a restart or a broker change.

Risk warning. Trading gold CFDs and other leveraged products carries a high risk of losing money quickly. Past results don't predict future results. GoldenStraddler doesn't give investment advice. Only trade with money you can afford to lose. The full risk disclosure is at goldenstraddler.com/risk.
